Local Healthcare Discovery Platform

Product Requirements, Problem Definition, Solution & Product Roadmap

Document Status: Product Definition / PRD
Initial Target: Rural & Semi-Urban India
Initial Focus: Doctor discovery, availability, healthcare-location information, health education, reminders and community-driven data verification

---

1. Product Vision

Build a simple healthcare discovery platform that helps people in rural and semi-urban areas answer a very basic but important question:

> **“Which doctor can I visit, where are they available, and when can I find them?”**

The platform will organize fragmented local healthcare information into one easily accessible system.

Instead of physically visiting or calling multiple pharmacies, clinics and hospitals to discover doctor availability, users should be able to search from their phone and find:

- Relevant doctors
- Doctor specialization
- Doctor's practice locations
- Days and timings
- Consultation fee
- Basic qualifications
- Contact information
- Location and directions
- Whether the doctor is expected to be available
- Other doctors available at the same establishment

The platform will initially be **admin-curated and community-assisted**, rather than depending on doctors to maintain their own profiles.

Over time, doctors and healthcare establishments can claim and manage their own information.

---

2. The Problem

2.1 Current Healthcare Discovery Problem

In many rural and semi-urban areas, healthcare information is highly fragmented.

A patient may need to visit:

- Government hospitals
- Private hospitals
- Nursing homes
- Local clinics
- Pharmacies / medical stores
- Diagnostic centres
- Individual doctor's chambers

Doctors may practice at different locations on different days.

For example:

Dr. Amit Das
Dermatologist

Monday → Maa Medical Store 5 PM – 8 PM
Tuesday → City Hospital 10 AM – 1 PM
Thursday → Maa Medical Store 5 PM – 8 PM
Saturday → Private Chamber 4 PM – 7 PM

This information is often not available through one reliable system.

---

3. Current Patient Experience

A typical patient journey may be:

Patient has a health problem
↓
Asks family/friends
↓
Goes to nearby pharmacy
↓
Asks whether a doctor is available
↓
Finds out doctor name

↓
Asks specialization
↓
Asks which day doctor comes
↓
Asks timing
↓
May discover doctor isn't available
↓
Visits another pharmacy/clinic/hospital
↓
Repeats the process
↓
Finally visits doctor

This creates:

- Unnecessary travel
- Wasted time
- Long waiting
- Uncertainty
- Dependence on word of mouth
- Difficulty finding specialists
- Difficulty knowing doctor schedules
- Outdated information
- Lack of visibility into doctors practicing at local pharmacies/clinics

---

4. Core Problem Statement

The problem is not necessarily that healthcare providers do not exist.

The problem is:

> **Existing healthcare providers and their schedules are difficult to discover because information is fragmented across pharmacies, clinics, hospitals, nursing homes and word-of-mouth networks.**

There is no simple, unified local system that tells a patient:

> **Who → What specialty → Where → Which day → What time → How to reach them**

---

5. Target Users

5.1 Patients

Primary users.

Especially:

- Rural users
- Semi-urban users
- People with limited technical knowledge
- Elderly users assisted by family
- Parents looking for pediatricians
- Users searching for specialists
- Users who don't know medical terminology

5.2 Pharmacy / Medical Store Staff

They may know:

- Which doctors visit
- Doctor schedules
- Temporary changes
- Whether doctors are currently practicing there

They can eventually help maintain information.

5.3 Clinic / Hospital / Nursing Home Staff

Receptionists or authorized staff can manage:

- Doctors
- Schedules
- Availability
- Location information
- Contact information

5.4 Doctors

Doctors are initially **not required to manage their own profiles**.

Later they can:

- Claim profiles
- Verify information
- Manage schedules
- Manage practice locations
- Update availability

5.5 Platform Admin

Initially the admin is the primary data manager.

Responsibilities include:

- Adding doctors
- Adding healthcare establishments
- Creating schedules
- Maintaining doctor/location relationships
- Verifying reports
- Updating incorrect information
- Managing healthcare content
- Monitoring data quality

---

6. Language & Accessibility

The patient-facing application should be designed for users with different levels of technical and medical literacy, particularly users in rural and semi-urban areas.

6.1 Supported Languages — V1

The patient app will support:

- **English**
- **Bengali (**বাংলা**)**

Users should be able to switch between languages from the application.

The selected language preference should persist across sessions.

6.2 What Should Be Localized

Both languages should support:

- App navigation
- Search interface
- Search suggestions
- Health/problem categories
- Filters
- Doctor availability labels
- Doctor visit reminders
- Notifications
- Health Guide content
- Buttons and actions
- Empty states
- Error messages
- Help/instructional text
- Report/feedback options

6.3 Healthcare Content

Health Guide content should be available in both English and Bengali.

Because the content is healthcare-related, Bengali translations should be reviewed for clarity and accuracy rather than relying entirely on automatic translation.

The language should remain simple and understandable to non-technical users.

6.4 Provider Information

Information such as:

- Doctor name
- Hospital/clinic/pharmacy name
- Address
- Phone number
- Qualification
- Registration information

should generally remain as entered by the administrator/provider rather than being automatically translated.

6.5 Future Language Expansion

The application should be architected for additional Indian languages without requiring a major redesign.

Potential future languages include:

- Hindi
- Odia
- Assamese
- Other regional languages based on geographic expansion

V1 language scope: English + Bengali.

---

7. Product Solution

The platform will provide a local healthcare discovery directory with five primary capabilities.

7.1 Doctor Discovery

Users can search for doctors using:

- Everyday health problems
- Medical specialization
- Doctor name
- Healthcare establishment
- Location

Examples:

> “Skin problem”
>
> “Gastric problem”
>
> “Kidney problem”
>
> “Child doctor”
>
> “Eye doctor”
>
> “Joint pain”

The user should **not need to know the medical specialty**.

---

8. Human-Friendly Search

Instead of forcing users to search:

> Dermatologist

allow:

> Skin problem

Instead of:

> Gastroenterologist

allow:

> Gastric problem

Instead of:

> Pediatrician

allow:

> Child doctor

The system can map everyday terms to relevant specialties.

This mapping should be treated as a discovery aid, **not a medical diagnosis system**.

---

9. Health Guide

A dedicated educational section will help users understand common health problems.

Example categories:

Digestive Health

- Acidity
- Gastric symptoms
- Constipation
- Diarrhea
- Indigestion

Skin

- Allergy
- Rash
- Itching

- Acne

Respiratory

- Cold
- Cough
- Breathing-related symptoms

Eye

- Eye irritation
- Red eyes
- Common eye symptoms

Bone & Joint

- Joint pain
- Back pain
- Muscle pain

Other

- Children's health
- Women's health
- Dental
- Ear/Nose/Throat
- Heart
- Kidney & urinary

---

10. Health Guide Content

Each article can include:

What is it?

Simple explanation.

Common symptoms

What people commonly experience.

What can be done at home?

General, low-risk self-care guidance where appropriate.

When should you see a doctor?

Warning signs and situations where professional care is appropriate.

Which type of doctor may help?

Relevant specialties.

Find a doctor

Direct link to local doctor discovery.

---

11. Important Health Content Principle

The platform should **educate, not diagnose**.

For example, if a user searches:

> “Gastric”

the platform should not claim:

> “You have gastritis.”

Instead:

> “These symptoms can have several possible causes. Learn about common symptoms and when you should consult a healthcare professional.”

Similarly, symptoms such as chest pain should not be reduced to a single specialty or diagnosis.

The platform should encourage appropriate professional care where necessary.

---

12. Doctor Profile

A doctor profile should contain:

- Name
- Photograph, if available
- Specialization
- Qualifications

- Experience, if verified
- Languages
- Consultation fee
- Contact information
- Practice locations
- Practice schedules
- Availability information
- Verification/update information

Example:

Dr. Amit Das

Dermatologist

MBBS, MD
Languages: Bengali, Hindi, English

Consultation Fee:
₹300

Practice Locations:

Maa Medical Store
Monday & Thursday
5 PM – 8 PM

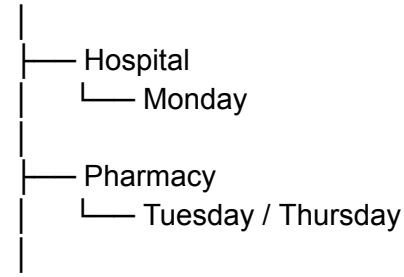

City Hospital
Tuesday
10 AM – 1 PM

---

13. Multiple Practice Locations

A doctor can have multiple practice locations.

This is a fundamental part of the data model.

Doctor

└── Private Chamber
    └── Saturday

The system should therefore model:

Doctor ↔ Practice Location ↔ Schedule

rather than assuming one doctor has only one clinic.

---

14. Healthcare Establishment Profiles

The platform will support:

- Hospitals
- Clinics
- Nursing homes
- Pharmacies / medical stores
- Doctor chambers
- Other relevant healthcare establishments

An establishment profile can show:

- Name
- Type
- Address
- Phone
- Opening hours
- Map location
- Doctors practicing there
- Doctor schedules
- Verification status

Example:

Maa Medical Store

Doctors practicing here:

Dr. Amit Das
Dermatologist
Mon / Thu
5 PM – 8 PM

Dr. Rahul Sen
General Physician

Tue / Fri
6 PM – 9 PM

---

15. Location & Navigation

Initially, the platform does not need to build its own navigation system.

Most hospitals, clinics and pharmacies already have Google Maps locations.

The admin can add the establishment's map location during data entry.

The application stores the required location/map information.

Users can select:

Get Directions

and be redirected to Google Maps.

This significantly reduces the complexity of the first release.

---

16. Location Discovery

Users should be able to search:

Near Me

or select:

- Village
- Town
- Area
- PIN code
- Location

The platform can then show relevant healthcare providers around that area.

---

17. Availability

Availability is one of the most important pieces of information.

Users should be able to see:

- Available today
- Available tomorrow
- Upcoming schedule
- Specific date
- Regular weekly schedule

Example:

Dr. Amit Das
Dermatologist

🟢 Available today

Maa Medical Store
5 PM – 8 PM

---

18. Availability Status

V1 can use simple states:

🟢 Available Today

The doctor is scheduled to practice today.

🟡 Scheduled

The doctor has an upcoming regular schedule.

⚪ Schedule Unavailable

Reliable schedule information is not currently available.

🔴 Not Available Today

The doctor normally practices today but has been marked unavailable.

---

19. Call to Confirm

Because real-world schedules can change, the platform should provide:

Call to Confirm

This can use the phone number of the pharmacy, clinic or hospital.

This is especially important during the early stage when schedules are manually maintained.

---

20. My Visits / Reminder System

V1 will not include appointment booking.

However, users can save a planned doctor visit.

Example:

Dr. Amit Das
Maa Medical Store

25 September
5:00 PM

[Remind Me]

The user can save it as a planned visit.

---

21. Visit Reminder

The platform can send a notification one day before:

🔔 **Doctor Visit Tomorrow**

You have planned a visit with Dr. Amit Das tomorrow at 5:00 PM.

📍 Maa Medical Store

Get Directions

A same-day reminder can also be introduced later.

---

22. My Visits

Users can see:

Upcoming Visits

Dr. Amit Das
Dermatologist

25 Sep · 5:00 PM
Maa Medical Store

[Get Directions]
[Cancel Reminder]

This is a personal reminder feature, not an appointment system.

The distinction is important:

> **“You planned to visit this doctor.”**

rather than:

> **“You have a confirmed appointment.”**

---

23. Community Reporting & Feedback

Because healthcare schedules change frequently, the platform needs a mechanism for users to report incorrect information.

The user can select:

> ⚠️ **Report Incorrect Information**

Possible reasons:

- Doctor is not available today
- Doctor no longer practices here
- Doctor's schedule has changed
- Doctor information is incorrect
- Pharmacy/clinic/hospital is closed
- Location is incorrect
- Doctor is no longer practicing
- Other

Users can optionally add a message.

Example:

> “The pharmacy said the doctor doesn't visit here anymore.”

---

24. Reports Must Not Automatically Change Data

A user report is a **signal**, not automatically verified truth.

The workflow is:

User Report
↓
Pending
↓
Admin Review
↓
Verify
↓
Update Information
↓
Resolve Report

Verification may happen through:

- Calling the establishment
- Contacting a responsible person
- Checking available information
- Confirming with authorized staff
- Later, contacting the doctor

---

25. Report Aggregation

If several users report the same problem, the admin should see the accumulated signal.

Example:

Dr. Amit Das — Maa Medical Store

7 users reported that the doctor was unavailable today.

Reports:

1. Doctor did not arrive
2. Pharmacy said doctor wasn't coming
3. Schedule appears changed
4. Doctor unavailable
5. Pharmacy confirmed different schedule

This helps prioritize data verification.

Multiple reports should trigger **verification**, not automatically mark the doctor unavailable.

---

26. Admin Report Dashboard

The admin should see:

Reports

Total: 248
Pending: 31
Reviewing: 8
Resolved: 197
Rejected: 12

Reports can be filtered by:

- Doctor
- Hospital
- Clinic
- Pharmacy
- Location
- Issue type
- Date
- Status

---

27. Doctor-Wise Reports

Example:

Dr. Amit Das

Total Reports: 18
Pending: 3
Resolved: 14
Rejected: 1

Admin can see:

- Report reason
- User message
- Location
- Date
- Report status
- Admin notes
- Verification action
- Resolution

---

28. Establishment-Wise Reports

Example:

Maa Medical Store

Total Reports: 27

Doctor unavailable 11
Schedule changed 7
Phone incorrect 4
Location issue 3
Other 2

This helps identify establishments where information frequently becomes outdated.

---

29. Data Verification

The platform should maintain verification/update metadata.

Examples:

✓ Verified recently

Last verified: 22 Sep 2026

or:

⚠ Schedule may have changed

Last verified: 45 days ago

This helps prevent stale information from appearing as guaranteed fact.

---

30. Initial Data Management Strategy

The initial system should **not depend on doctors creating accounts**.

Instead:

Phase 1

Platform Admin

collects and manages information.

Phase 2

Pharmacy / Clinic / Hospital Staff

can receive access to manage their establishment and doctor schedules.

Phase 3

Doctors

can claim their existing profile.

Phase 4

Doctors

can directly manage their information.

This gradual transition is critical because doctors may not have time or motivation to maintain another application during the early stage.

---

31. V1 Admin Capabilities

Admin should be able to:

Doctor Management

- Create doctor
- Edit doctor
- Add specialization
- Add qualifications
- Add languages
- Add consultation fee
- Add contact information
- Add/remove practice locations

Schedule Management

- Create weekly schedule
- Add different schedules per location
- Mark temporary unavailable
- Modify schedule
- View upcoming schedules

Establishment Management

- Create hospital
- Create clinic
- Create pharmacy
- Create nursing home
- Add address
- Add phone
- Add map location
- Add doctors
- Manage operating information

Content Management

- Create health categories
- Create health articles
- Manage article content
- Connect health topics with specialties

Reports

- View reports
- Filter reports
- Review messages

- Verify reports
- Update data
- Resolve/reject reports
- Add admin notes

---

32. V1 Patient Features

Discovery

- Search by everyday problem
- Search by specialization
- Search doctor
- Search establishment
- Search by location
- Nearby discovery
- Available today
- Specific-date schedule

Doctor

- Doctor profile
- Specialization
- Qualification
- Languages
- Consultation fee
- Practice locations
- Schedule
- Contact
- Directions

Establishment

- Hospital profile
- Clinic profile
- Pharmacy profile
- Nursing home profile
- Doctors practicing there
- Schedule

Health

- Health Guide

- Common symptoms
- General self-care information
- Warning signs
- When to consult a professional
- Related doctor categories

Personal Utility

- Save planned doctor visit
- Reminder notification
- My Visits
- Get Directions

Data Quality

- Report incorrect information
- Report doctor unavailable
- Report schedule changes
- Report doctor no longer practicing

---

33. Explicitly Out of Scope for V1

The following should **not** be part of the initial release:

- Doctor self-registration
- Doctor self-managed profiles
- Online appointment booking
- Appointment slot management
- Online payments
- Telemedicine
- Online consultation
- Prescription management
- Digital medical records
- Online medicine ordering
- AI diagnosis
- Automated medical diagnosis
- Insurance management
- Complex patient medical history

The purpose of excluding these features is to keep V1 focused on solving the original discovery problem.

---

34. Launch Strategy

Launch 0 — Internal Data Preparation

Before public launch:

- Define doctor data structure
- Define establishment structure
- Define specialization structure
- Define schedule model
- Build initial directory
- Add initial healthcare establishments
- Add initial doctors
- Verify initial information
- Add map locations
- Prepare health content
- Test report workflow

Target:

> Build a reliable initial healthcare directory in one selected geographic area.

---

35. Launch 1 — Healthcare Discovery MVP

Goal

Solve:

> **“Where can I find a doctor?”**

Features:

- Doctor search
- Problem-based search
- Specialization search
- Location search
- Doctor profiles
- Establishment profiles
- Doctor schedules
- Availability
- Google Maps directions

- Call to confirm

Admin controls all information.

No booking.

No doctor accounts.

---

36. Launch 1.1 — Health Guide

Add:

- Health categories
- Common symptoms
- General self-care guidance
- Warning signs
- When to consult a doctor
- Related specialties
- Find-doctor CTA

Goal:

> Help users understand what type of healthcare service may be relevant without claiming to diagnose them.

---

37. Launch 1.2 — My Visits

Add:

- Save planned doctor visit
- Upcoming visits
- One-day-before notification
- Same-day reminder
- Location link
- Cancel reminder

Goal:

> Provide personal utility without requiring appointment infrastructure.

---

38. Launch 1.3 — Community Verification

Add:

- Report incorrect information
- Report doctor unavailable
- Report schedule changes
- Report doctor no longer practicing
- Report establishment information
- Admin report dashboard
- Doctor-wise report history
- Establishment-wise report history
- Report verification workflow

Goal:

> Make the directory progressively more reliable through real-world feedback.

---

39. Launch 2 — Establishment Participation

Allow authorized:

- Pharmacy owners
- Pharmacy staff
- Clinic receptionists
- Hospital staff
- Nursing home staff

to manage relevant information.

They can:

- Update doctor schedules
- Mark doctor unavailable
- Confirm doctor availability
- Update establishment information

Admin remains in control and can verify changes.

---

40. Launch 3 — Doctor Claim & Profile

Existing doctor records can become claimable.

Example:

> **Are you Dr. Amit Das?**
>
> Claim this profile.

Doctor verifies identity and gains access.

Initially they can update:

- Profile
- Qualification
- Specialization
- Languages
- Locations
- Schedule
- Consultation fee

This avoids forcing doctors to create their profile from scratch.

---

41. Launch 4 — Doctor-Managed Availability

Doctors can manage:

- Today's availability
- Leave
- Temporary absence
- Schedule changes
- Multiple practice locations
- Special dates
- Consultation hours

This improves real-time data accuracy.

---

42. Launch 5 — Appointment Booking

Only after sufficient provider and patient adoption should booking be introduced.

Possible flow:

Find Doctor
↓
Doctor Profile
↓
Practice Location
↓
Available Date
↓
Available Slot
↓
Book
↓
Confirmation

Potential features:

- Appointment requests
- Slot management
- Booking confirmation
- Cancellation
- Rescheduling
- Queue/token management
- Appointment reminders

---

43. Future Scope

Once the core directory is established, the platform can gradually expand.

Healthcare Services

- Diagnostic centres
- Blood banks
- Ambulance services
- Pharmacies
- Physiotherapy
- Dental services
- Eye care
- Maternal care
- Child healthcare

- Home healthcare

Advanced Discovery

Users could eventually search:

> “Blood test near me”
>
> “24-hour pharmacy”
>
> “Emergency hospital”
>
> “X-ray near me”
>
> “Child specialist available today”
>
> “Diagnostic centre open now”

---

44. Emergency & Urgent Care Discovery

A future version could provide:

- Nearby emergency hospitals
- Emergency contact numbers
- Ambulance information
- 24-hour facilities
- Blood bank discovery
- Emergency directions

This should remain a carefully designed safety-critical feature.

---

45. Patient Accounts

Future versions may support:

- User profile
- Saved doctors
- Saved establishments
- Visit history
- Reminder history

- Preferred locations
- Family members

---

46. Family Healthcare

A future feature could allow one user to manage reminders for family members.

Example:

Family

Father
└── Doctor visit

Mother
└── Follow-up reminder

Child
└── Pediatrician visit

---

47. Doctor Ecosystem

Eventually doctors can have:

- Verified profiles
- Multiple clinics
- Schedule management
- Appointment management
- Patient queue
- Availability
- Notifications
- Reviews/feedback, subject to appropriate safeguards
- Professional profile

---

48. Healthcare Establishment Ecosystem

Hospitals, clinics and pharmacies can eventually get dashboards.

They can manage:

- Doctors
- Schedules
- Availability
- Staff
- Contact information
- Services
- Patient appointment queues
- Reports
- Analytics

---

49. Intelligent Search

A future version could understand natural language better.

User:

> “My stomach has been burning for two days. Is there a doctor nearby?”

The system can:

1. Understand the user's general concern.
2. Provide general educational information.
3. Suggest relevant care categories.
4. Show nearby providers.
5. Highlight currently available providers.

It should remain an **information and navigation assistant**, not a diagnostic engine.

---

50. Data Intelligence

As the platform grows, the system can identify:

- Frequently reported doctors
- Frequently changing schedules
- Establishments with stale data
- Areas with insufficient healthcare coverage
- Most searched specialties
- Popular healthcare locations
- Frequently searched health topics

This can help prioritize platform operations.

---

51. Geographic Expansion

The initial launch should focus on a limited geographic area.

For example:

One town
↓
Nearby villages
↓
Sub-division
↓
District
↓
State
↓
Multiple states

The product should prove the data collection and verification model locally before attempting large-scale expansion.

---

52. Core Product Flywheel

The long-term growth loop can become:

More Healthcare Providers
↓
Better Directory
↓
More Useful Search
↓
More Patients
↓
More Usage
↓
More Community Reports
↓
Better Data Accuracy
↓

More Trust
↓
More Healthcare Providers

Eventually:

Admin-managed
↓
Community-assisted
↓
Establishment-managed
↓
Doctor-managed
↓
Real-time healthcare network

---

53. Product Principles

The platform should follow these principles.

1. Simple First

A user should not need technical knowledge.

2. Local First

Focus on the healthcare reality of the target locality.

3. Human-Friendly Language

Use:

“Skin problem”

rather than only:

“Dermatology”

4. Accurate Over Extensive

A smaller reliable directory is more valuable than a huge outdated directory.

5. Don't Depend on Doctors Initially

The platform should work even when doctors don't actively participate.

6. Community-Assisted Verification

Users can report real-world changes.

7. Admin Verification

Reports should not automatically change healthcare information.

8. No Diagnosis

Health content should educate and guide users toward appropriate care rather than diagnose them.

9. Gradual Complexity

Start with discovery.

Then introduce participation.

Then availability.

Then booking.

---

54. Core V1 User Journey

Scenario

A user has a skin problem.

Open App
↓
Search "Skin problem"
↓
Select location / Near Me
↓
See nearby dermatologists
↓
Filter "Available Today"
↓
Select Doctor
↓
See:
- Name

- Specialization
- Qualification
- Fee
- Location
- Schedule

↓

Call to Confirm

↓

Get Directions

↓

Save Visit

↓

Receive reminder

---

55. V1 Alternative User Journey

User knows the pharmacy but doesn't know the doctor.

Search "Maa Medical Store"

↓

Establishment Profile

↓

Doctors Practicing There

↓

Dr. Amit Das

↓

Schedule

↓

Plan Visit

---

56. V1 Data Accuracy Journey

Platform shows:

Dr. Amit Das
Thursday
5 PM – 8 PM

↓

User visits pharmacy

↓

Doctor isn't there

↓

User reports:

"Doctor doesn't come on Thursday anymore."

↓

Admin receives report

↓

Admin verifies with pharmacy

↓

Schedule updated

↓

Report resolved

↓

Future users see correct information

This feedback loop is a core product mechanism, not just a support feature.

---

57. Success Metrics

Initial success should not be measured primarily by bookings because booking is not part of V1.

Instead track:

Directory

- Number of doctors
- Number of establishments

- Number of active locations
- Number of verified schedules

Discovery

- Searches
- Doctor profile views
- Establishment profile views
- Directions clicks
- Call clicks

Health Guide

- Article views
- Search-to-article journeys
- Article-to-doctor discovery

Reliability

- Number of reports
- Reports per doctor
- Reports per establishment
- Average report resolution time
- Percentage of verified/corrected reports

Retention

- Returning users
- Saved visits
- Reminder usage

---

58. Long-Term Product Vision

The ultimate vision is not simply:

> **A doctor listing application.**

It is:

> **A local healthcare information and access network that connects patients with doctors and healthcare establishments through reliable, continuously updated information.**

The evolution is:

---

59. Current Scope — Final Definition

The current product scope is:

DISCOVER

Find doctors by:

- Health problem
- Specialization
- Doctor
- Location
- Hospital
- Clinic
- Pharmacy

UNDERSTAND

Health Guide with:

- Common symptoms
- General information
- Basic self-care guidance
- Warning signs
- When to consult a professional
- Relevant healthcare categories

PLAN

Save planned doctor visits and receive reminders.

NAVIGATE

Open the healthcare establishment directly in Google Maps.

VERIFY

Allow users to report inaccurate or outdated information.

MANAGE

Admin manages:

- Doctors
- Establishments
- Locations
- Schedules
- Availability
- Health content
- Reports
- Verification

NOT YET

- Doctor self-management
- Establishment self-management
- Appointment booking
- Payments
- Telemedicine
- Medical records
- Prescription management
- Online pharmacy
- AI diagnosis

---

60. One-Line Product Definition

> **A simple local healthcare discovery platform that helps people find the right doctor near them, know where and when the doctor is available, understand common health concerns, remember planned visits, navigate to healthcare locations, and help keep local healthcare information accurate through community reporting.**

---

61. Product Evolution in One View

Version	Focus
V0	Admin builds verified local healthcare directory
V1	Doctor + establishment discovery, schedules, availability, maps
V1.1	Health Guide
V1.2	My Visits + reminders
V1.3	Community reports + admin verification
V2	Pharmacy/clinic/hospital staff participation
V3	Doctor profile claiming
V4	Doctor-managed profiles & availability
V5	Appointment booking
V6	Queue, payments, telemedicine and additional healthcare services
Future	Broader local healthcare ecosystem

---

62. Final Product Philosophy

The first problem to solve is **not appointment booking**.

The first problem is:

> **“I need healthcare. Where do I go, which doctor should I look for, and when can I actually find them?”**

Once the platform solves that problem reliably, everything else can be layered on top.

The initial product therefore focuses on:

Discovery → Information → Availability → Location → Reminder → Verification

rather than trying to become a complete healthcare platform from day one.
